

Assessment 1: Text Analysis – Detailed Description

AT1: NLP for data analysis (Python code + Markdown report)

Type:	Individual assessment
Length:	Python code + Markdown report
Weight:	30%
Due:	Wednesday, 19 August

Task

Students should perform text analysis on the provided data set using Python and write the report in markdown format that combines text and code.

For this task, you should explore, analyse, manipulate, visualise, and interpret the provided text data to derive insights. An important part of this exercise is sensemaking, crafting the narrative, and storytelling to be clear and engaging, which nurtures your skill to communicate findings from the data. The data set description offers specific expectations in relation to the provided data set and will be released on Canvas following the first in-class session in Week 1.

Data set description

Parliamentary inquiries in Australia, often conducted by committees, investigate issues to provide recommendations for better legislation, public policy, and public awareness. They involve gathering information, analysing evidence, and reporting findings to the parliament. They enable public participation in policy development and contribute to better-informed legislation and policy. Anyone can make a submission to the inquiry to get their views heard - read more about the submission process [here](#).

Most submissions to parliamentary inquiries are made public and published on the committee's website. For this assignment, students will be working on submissions from the inquiry into the value of skilled migration to Australia. The list of 145 submissions can be found on https://www.aph.gov.au/Parliamentary_Business/Committees/Joint/Migration/Skilledmigration/Submissions. For ease of use, all these submissions have been downloaded as PDF and provided to you in an archived file. Make sure you are also using metadata such as the filename which indicates who made the submission. FAQs on the legislation itself can be found [here](#) in the webpage by the Australian Electoral Commission.

Report Template

A sample template (of Python notebook) has been provided for download along with the dataset on Canvas. It provides sample blocks to ensure you cover the basic requirements of this assignment; you are free to adapt it to your need as required. We recommend creating separate sections for each text analysis approach you employ and number them accordingly. For each section, provide a description of the method, a well-documented code block, results and charts,

and explanation of results in your own words. Make sure you provide a text explanation to expand on your results and charts. Do not leave interpreting the results to your reader!

Based on the full analysis, write your short interpretive summary (1-2 paragraphs) on the key findings from your inquiry analysis and your own thinking on the topic as a conclusion. Provide supportive evidence (from research) and graphs (from analysis) where appropriate and add your reflections on the process.

Note: You are free to add other external sources to bring additional context to your analysis.

FAQs and additional details are on Canvas.

Assessment criteria for AT1:

Criteria	Weight (%)	SLOs	CILOs
Technical proficiency in analysis, explanation and justification of code choices	35	1, 3	1, 2, 3
Effectiveness in communicating insights using written explanations and data visualizations	40	4, 5	1, 4
Quality of report in terms of readability, structuring, and originality	25	3	3, 4
