

Assignment 1: Text Analysis FAQs

Q: What is the format of AT1 submission?

A: You are required to submit two files for this assignment:

1. Colab/ Jupyter notebook (.ipynb file) – This version containing code and text is called [Markdown](https://colab.research.google.com/notebooks/markdown_guide.ipynb)  [. \(https://colab.research.google.com/notebooks/markdown_guide.ipynb\)](https://colab.research.google.com/notebooks/markdown_guide.ipynb). Since it is a report, the code should be presented along with the supporting text explaining the contents of the report. You may use a [Markdown guide](https://handbook.gitlab.com/docs/markdown-guide/)  [\(https://handbook.gitlab.com/docs/markdown-guide/\)](https://handbook.gitlab.com/docs/markdown-guide/) to format the contents.
2. Report (.pdf version) - You can export a Colab notebook as a pdf by saving as a pdf; it is much easier to do using a local [Jupyter](https://jupyterlab.readthedocs.io/en/stable/user/export.html)  [notebook](https://jupyterlab.readthedocs.io/en/stable/user/export.html)  [. \(https://jupyterlab.readthedocs.io/en/stable/user/export.html\)](https://jupyterlab.readthedocs.io/en/stable/user/export.html) and is highly recommended. If you face issues in a PDF export, you may submit a .HTML file instead.

IMPT: Do not submit them as a zip/ archive file. They should be submitted as two individual files!

We highly recommend running a local Jupyter notebook for this analysis. It lets you export the ipynb file as a PDF. If you are using Google colab, steps you might follow to get the [PDF version might be different \(StackOverflow instructions\)](https://stackoverflow.com/questions/52588552/google-co-laboratory-notebook-pdf-download)  [. \(https://stackoverflow.com/questions/52588552/google-co-laboratory-notebook-pdf-download\)](https://stackoverflow.com/questions/52588552/google-co-laboratory-notebook-pdf-download).

Q: What insights should we find and how? Do we need to have a hypothesis when working with the data?

A: We usually come up with problem statements or hypotheses when working with data to derive useful insights. It would be best if you framed the right question to ask first, and then use text analysis and visualization techniques to derive insights from the data.

You can also start the other way around if you think an exploratory analysis will help you find those directions and help answer specific AT1 questions from the brief. I demonstrated examples with the news dataset (and tutorial) to show what we expect to see for this assignment, which you may revisit for ideas. It is the same dataset the entire cohort will be working with, so to stand out, you should highlight what you find interesting and why by choosing unique angles to tackle. This is what brings value to a data professional's work more so than the actual analysis itself. Here's an example of a well-executed data story from the Telegraph highlighting numbers and trends in Africa: <http://s.telegraph.co.uk/graphics/projects/Africa-in-100-years/index.html>  [Links to an external site. \(http://s.telegraph.co.uk/graphics/projects/Africa-in-100-years/index.html\)](http://s.telegraph.co.uk/graphics/projects/Africa-in-100-years/index.html)

Q: Can I use the same code from the tutorials for AT1 analysis?

A: You may reuse parts of it, but you are recommended to write your own code as the exercise is for you to learn to program using NLP. You should explore related libraries and functions to perform additional analysis, and provide a detailed explanation of the results and insights. The newer types of analysis and techniques you implement, the higher your grades will be. Remember, assignments are for *you* to demonstrate your own learning (not just for educators to assess).

Q: Is it sufficient to apply analysis methods and present the code only?

A: No, data storytelling and reporting is a key requirement for this assignment. Storytelling involves building a compelling narrative based on data and analytics to inform your audience. This is often accompanied by statistics (percentages, descriptive statistics, counts etc.) and visualisations (bar graphs, wordclouds, etc.). If you don't have many numerical values and categories, don't be afraid to create new ones from the text data. Note that coming up with a visual is not enough - you should explain what you found is interesting, and present data stories from it. Below is an interesting example from the [cheat sheet for data storytelling](https://res.cloudinary.com/dyd911kmh/image/upload/v1662633286/Marketing/Blog/Data_Storytelling_Cheat_Sheet.pdf) [↗](https://res.cloudinary.com/dyd911kmh/image/upload/v1662633286/Marketing/Blog/Data_Storytelling_Cheat_Sheet.pdf)
https://res.cloudinary.com/dyd911kmh/image/upload/v1662633286/Marketing/Blog/Data_Storytelling_Cheat_Sheet.pdf :

The page here contains sample visualisations at the Data Story section: <https://www.data-to-viz.com/>. [↗](https://www.data-to-viz.com/) [\(https://www.data-to-viz.com/\)](https://www.data-to-viz.com/)

Also don't shy away from adding external datasets if they add to your analysis!

Q: How much explanation/ text should I provide in my markdown?

A: The short answer is that there is no single guide. Remember, you are writing a report on your analysis, so the more explanation you write, the better! But everyone writes differently, and you may be able to convey key information in much less words than someone else; what we are looking for is clarity of expression, interesting questions, and useful insights from the given data set. You will see that in general, well-written reports have a nice blend of introductory text,

explanation on the techniques used, and explanation of findings (We've provided a couple of exemplars in the next page for your reference)
